What Americans Think of Willpower

A Survey of Perceptions of Willpower & Its Role in Achieving Lifestyle and Behavior-Change Goals
The American Psychological Association commissioned Harris Interactive to conduct the 2011 Stress in America™ survey to understand the perceptions of stress and its impact among the general public. After the survey concluded, all respondents who were still active Harris Poll panelists were re-contacted to participate in a follow-up survey.

The goal of this research is to build upon the 2011 Stress in America survey by taking a deeper look at the role of willpower and motivation when making lifestyle and behavior changes.

The Stress in America™ follow-up survey was conducted online within the United States by Harris Interactive on behalf of the American Psychological Association between December 22 and 30, 2011 among 566 of the 1226 adults who participated in the 2011 Stress in America™ survey. The response rate for the follow-up survey was 46 percent.

Results were weighted as needed for age, sex, race/ethnicity, education, region and household income. Propensity score weighting was also used to adjust for respondents’ propensity to be online.

Because the sample is based on those who were invited to participate in the Harris Interactive online research panel, no estimates of theoretical sampling error can be calculated.
The following terms are used throughout the report and defined as follows:

- "Motivated" = Adults ages 18+ who report they are extremely or very motivated to make the lifestyle and behavior changes they are working on (Q700)
- "Not motivated" = Adults ages 18+ who report they are somewhat or not at all motivated to make the lifestyle and behavior changes they are working on (Q700)
- "Consistent" = Adults ages 18+ who report their motivation level to make the lifestyle and behavior changes they are working on is very or somewhat consistent (Q705)
- "Inconsistent" = Adults ages 18+ who report their motivation level to make the lifestyle and behavior changes they are working on is very or somewhat inconsistent (Q705)

Significant differences are noted by small colored boxes, such as this: 🔴

- A small colored box such as, "🔴," appearing next to a percentage in a chart or call-out box indicates that percentage is significantly higher than the percentage corresponding to the color of that box.
- For example, 🔴66% 🔴36% means that 66 percent is significantly larger than 36 percent.

Responses may not add up to 100 percent due to weighting, computer rounding or the acceptance of multiple responses.
Executive Summary – Willpower Findings

- Almost everyone (93 percent) surveyed reported making a resolution to change some aspect of their behavior in 2012. Yet people consistently report that a lack of willpower is the top reason they fall short of their goals to lose weight, save more money, exercise or make other lifestyle changes.

- The most frequently reported goals that people set for 2012 were those aimed at improving health (57 percent reported a goal to lose weight, 50 percent reported a goal to eat a healthier diet, and 41 percent reported a goal to start exercising regularly) or financial status (52 percent reported a goal to save more money, and 37 percent reported a goal to pay off debt), according to the follow-up survey. For adults trying to make a lifestyle change, however, willpower is an important factor. The annual Stress in America survey found that one in four reported that lack of willpower (27 percent) or time (26 percent) prevented them from making the change they were trying to achieve. Despite difficulties with willpower, a majority of those responding to the annual survey (71 percent) believe that willpower can be learned, which is good news since psychological research demonstrates that this is true.
The vast majority of adults in the annual Stress in America™ survey have either received a recommendation to make a lifestyle change or have decided to do so independent of a recommendation. In addition, adults have reported that although they find healthy behaviors to be important, they are having a difficult time being successful at leading a healthy lifestyle. Year after year, willpower is the most commonly cited barrier to making lifestyle and behavior changes.

- Over the past five years, most adults have set goals for themselves to improve their health in some way including eating a healthier diet (77 percent), exercising more (75 percent), losing weight (66 percent), reducing stress (60 percent) and getting more sleep (58 percent).

- In the annual survey, when adults were asked to identify barriers preventing them from making lifestyle changes they decided to make or that were recommended to them, the most common barrier cited was lack of willpower (27 percent).

- Despite setting these goals, more than half (52 percent) say they did not use any strategy to help them be successful.
In the follow-up survey, adults who reported in the original survey that they had decided to make a change or that they had received a recommendation to make a change were asked a follow-up question about the status of their change. With the exception of reducing or eliminating alcohol consumption, the majority had not made or were not maintaining the change. However, it is likely that utilizing effective strategies to help them achieve their goal will improve the likelihood of success.

- Fewer than half of adults who indicate a change was recommended or they decided to make a change when they were interviewed in August or September of 2011 report that they have made or are maintaining the change with the exception of reducing or eliminating alcohol consumption.
- Although half of adults (50 percent) find monitoring their progress to be an important element when working to make a lifestyle or behavior change, only 30 percent report they do an excellent or very good job monitoring their progress.
  - However, those who reported they track their goals by writing them down or logging them electronically were more likely than those who tracked their goals mentally to report successfully exercising more (45 percent vs. 34 percent) and reducing stress (35 percent vs. 23 percent).
Motivation seems to be playing a key role in success as those who are more highly motivated to make lifestyle and behavior changes are significantly more likely than those with lower motivation to report success in achieving the goals they have set for themselves.

- When asked to describe their motivation levels and consistency of motivation, less than half described themselves as extremely or very motivated to make the behavior changes (37 percent).
  - Furthermore, less than one-fifth (17 percent) described their motivation level as very consistent.
- However, adults who report that they are extremely or very motivated to make the lifestyle or behavior change were significantly more likely than those who report that they are somewhat or not at all motivated to report success for the following: eating a healthier diet (71 percent vs. 29 percent), getting more sleep (48 percent vs. 26 percent), exercising more (65 percent vs. 12 percent), losing weight (47 percent vs. 10 percent), and reducing stress (43 percent vs. 7 percent).
When adults were asked during the 2011 Stress in America survey what barriers prevented them from making lifestyle changes they decided to make or that were recommended to them, the most common barrier cited was willpower (27 percent).

Q2255 Which of the following, if any, have prevented you from making the lifestyle changes your health care provider has recommended? Please select all that apply. *Wording changed in 2011 to ‘Which of the following, if any, have prevented you from making the lifestyle changes you decided to make or that were recommended to you? Please select all that apply.’
The majority of adults (71 percent) say willpower can be learned.
The most common definitions of lack of willpower include giving in to temptation (39 percent), not being motivated or caring enough (30 percent), and not being disciplined or organized enough (27 percent).

- I give in to temptation: 39%
- I'm not that motivated or don't care enough about it: 30%
- I'm not disciplined or organized enough to make changes: 27%
- I get too discouraged: 22%
- I know better, but my emotions always take over: 22%
- I can't stick with a plan: 21%
- I do not have the energy: 20%
- It takes too long, so I give up: 18%
- I haven't really decided to make changes: 17%
- I have other responsibilities that come first: 16%
2011 Stress in America: Defining “Lacking Willpower” (con’t)

Which of the following most closely defines what lacking willpower means to you? Please select all that apply.

- I have other responsibilities that come first: 16%
- I have too much stress in my life: 14%
- I don't have enough to keep me distracted from...: 13%
- I lose sight of the reward that reaching my goal...: 12%
- I have too many decisions to make and get...: 11%
- I don't have the ability to control things on my own: 10%
- I know I need to make changes, but I don't know...: 9%
- Other: 1%
- None of these: 17%

BASE: All respondents SiA 2011 (n=1226)
* Multiple responses are possible
Q7035 Which of the following most closely defines what lacking willpower means to you? Please select all that apply.
Nearly 4 in 10 (38 percent) of those who reported that lack of willpower prevented them from making a behavior change selected time as the resource they think would help them improve their will power.

Which of the following do you think would most help you improve your willpower?

- Time: 38%
- Money: 35%
- Encouragement/support from family members and/or friends: 31%
- Guidance from a professional: 22%
- More flexibility of when, where, or how much I work: 21%
- Fewer responsibilities: 20%
- Closer proximity to resources: 19%
- Having fewer decisions to make: 16%
- Help with household duties: 12%
- None of the above: 16%

**BASE:** SiA Willpower has prevented lifestyle changes 2011 (n=340)  
Q7050 Which of the following do you think would most help you improve your willpower? Please select all that apply.
For those whom willpower has prevented them from making changes, having more energy (being less tired) (50 percent) and having more confidence in their abilities (40 percent) are seen as needed to improve willpower.
When adults were asked if they had been recommended by anyone to make any lifestyle or behavior changes in the Stress in America survey, again the most common recommendations were to exercising more (44 percent), losing weight (37 percent), and eating a healthier diet (35 percent).

Regardless if you have decided to make these changes, has anyone recommended you do any of the following in the past 5 years?

- Exercising more: 44%
- Losing weight: 37%
- Eating a healthier diet: 35%
- Reducing stress: 26%
- Getting more sleep: 24%
- Quitting smoking: 13%
- Reducing or eliminating alcohol consumption: 8%
With the exception of reducing or eliminating alcohol consumption and quitting smoking, the majority of adults that attempted to make a lifestyle or behavior change were not successful in making the change; however, a sizeable percentage report they are still attempting to make the change.
