CHAPTER 2: RECOMMENDATIONS FOR THE TREATMENT OF ASIAN AMERICAN/PACIFIC ISLANDER POPULATIONS

By Gayle Y. Iwamasa, PhD
Asian American Psychological Association

Introduction

According to the 2000 U.S. Census, “single race” Asian Americans and Pacific Islanders comprised 4.2% of the U.S. population. Of the individuals who reported being multiracial, almost 13% reported being partially of Asian heritage. Asian Americans/Pacific Islanders is one of the fastest growing visible racial/ethnic groups, with a projected increase in population to 6.2% by 2025, and 8.9% by 2050. Although the three largest Asian ethnic groups are Japanese, Chinese, and Filipino, the terms “Asian American” and “Pacific Islander” encompass more than 50 distinct racial/ethnic groups, in which more than 30 different languages are spoken. Indeed, Asian Americans/Pacific Islanders is the most diverse racial/ethnic group in terms of country of origin, religious/spiritual affiliation, cultural background and traditions, and generational and immigration experiences.

Prevalence rates of mental illness among Asian Americans/Pacific Islanders are believed to be no different from those of other Americans. However, the type of psychopathology, ethnicity and generational status, acculturation and cultural background all appear to influence the manifestation of psychological distress among Asian Americans/Pacific Islanders. For example, rates of depression appear to be similar among Asian Americans/Pacific Islanders and White Americans, while the prevalence of substance abuse appears to be significantly lower among Asian Americans/Pacific Islanders. In contrast to domestically born Asian Americans, Southeast Asian and other Asian American/Pacific Islander immigrants who experienced violence, war, or economic oppression prior to their arrival in the United States appear to suffer psychological distress more frequently.

Understanding the mental health issues of Asian Americans/Pacific Islanders is important because of the vast heterogeneity of the group, the various Asian cultures’ beliefs about mental health, and the emphasis on the connection between the mind and body. Among many Asian Americans/Pacific Islanders, interpersonal harmony and the focus on family influence the experience, interpretation, and expression of psychological distress. For example, in some Asian cultural groups, the experience of psychological distress is not only a reflection on the individual in distress, but also reflects on the entire family. Thus, shame, embarrassment, and loss of face contribute to whether or not an individual will admit to experiencing psychological problems. These cultural values affect the willingness of Asian Americans/Pacific Islanders to seek professional psychological treatment; Asian Americans/Pacific Islanders have been found to underutilize traditional mental health services. In addition to cultural values such as stigma and loss of face, limited English proficiency, differing conceptualizations of distress, and limited access to culturally competent services also contribute to low treatment utilization rates. Psychological researchers have documented that those Asian Americans/Pacific Islanders who do seek professional mental health treatment are more likely to terminate treatment prematurely.

Implications for Culturally Competent Care

- There is an increased need for culturally competent mental health services and providers with expertise in working with this population.

- Mental health providers must be aware of the great interethnic variations among Asian Americans/Pacific Islanders.

- Because the manifestation of mental disorders is affected by cultural, generational, and acculturation levels, treatment providers must assess these specific cultural factors when working with Asian American/Pacific Islander clients.

- Treatment providers need to understand the role of cultural values such as interpersonal harmony, loss of face, and filial piety on their Asian American/Pacific Islander client’s beliefs about psychological distress and the implications for mental health services.

Myths and Misinformation

The promulgation of the “model minority” myth, that Asian Americans and Pacific Islanders are the most similar to European Americans, and, thus, are viewed as “models” for and/or “better than” other ethnic minority groups, has created many problems for Asian Americans/Pacific Islanders. The result has been (a) a lack of attention to Asian American/Pacific Islander issues in mental health research and clinical practice, (b) the creation of antagonisms with other minority groups who may view Asian Americans/Pacific Islanders as co-conspirators with European Americans, and (c) interference with the development of collaborative efforts and coalition building among racial/ethnic minority groups.

Another erroneous belief about Asian Americans/Pacific Islanders is that they all achieve academic success. Although it is true that education is highly valued in many traditional Asian cultures, the within-group differences in academic achievement among various Asian Americans/Pacific Islanders are large. Academic achievement among Asian Americans/Pacific Islanders has been found to vary by ethnicity, generational status, gender, and socioeconomic status.
Regarding socioeconomic status, although some Asian Americans and Pacific Islanders are somewhat better off financially as compared to other ethnic minority groups, they are still more than 1-1/2 times more likely than White Americans to live in poverty. Also, in many Asian American/Pacific Islander households, all individuals of working age (including adolescents and extended family members) are employed in one or more jobs outside the home, resulting in a higher medium family income. These figures are often used to support the success myth when in actuality they are a statistical artifact.

Type of employment is also quite diverse among Asian Americans and Pacific Islanders. Many Asian American/Pacific Islander immigrants, although often trained in specific vocations such as medicine, engineering, and business, can only find menial low-paying jobs, which is why they often supplement their income with additional employment. Even among highly educated and acculturated Asian Americans/Pacific Islanders, research has documented a glass-ceiling effect, whereby many Asian Americans and Pacific Islanders are unable to be promoted beyond a certain position because of discrimination and institutionalized racism and/or sexism.

Finally, the stereotype of Asian American/Pacific Islander individuals all looking the same is grossly inaccurate if one simply examines the range of phenotype between various Asian American/Pacific Islander groups. For example, Filipinos, Korean Americans, Native Hawaiians, and Cambodian immigrants are quite different phenotypically. Skin color, hair color and texture, facial features, height, weight, etc., vary dramatically among many of the Asian American/Pacific Islander ethnic groups, and biracial and multiracial Asian Americans and Pacific Islanders have even more phenotypic differences.

Implications for Culturally Competent Care

- Treatment providers should be aware of inaccurate historical stereotypes and myths about Asian Americans/Pacific Islanders and how they have affected the mental health of Asian Americans/Pacific Islanders.
- Treatment providers should assess their own stereotypes and myths about Asian Americans/Pacific Islanders and work to abolish them.
- Treatment providers should be knowledgeable of the diversity in educational and occupational achievement among Asian Americans/Pacific Islanders.
- Treatment providers should be knowledgeable about the socioeconomic status of Asian Americans/Pacific Islanders and the frequent need for family members to have multiple employment in order to make ends meet.
- Treatment providers should understand that Asian Americans and Pacific Islanders are immensely diverse in many ways and not make assumptions about a client’s experiences and adherence to traditional cultural values and practices.

Inadequacies of Traditional Mental Health Care

The number of Asian American/Pacific Islander mental health providers is very low, as are mental health services accessible to various Asian American/Pacific Islander communities. The paucity of bilingual and culturally competent therapists compounds the problem of inadequate mental health care. Even the U.S. Surgeon General documented inadequate mental health treatment for Asian Americans and Pacific Islanders because of inappropriate and biased treatment models that reflect a White American, middle-class orientation.

Historically, Asian Americans and Pacific Islanders have had good reason to mistrust mental health service providers. Misdiagnosis and underdiagnosis of mental illness among Asian Americans and Pacific Islanders who have serious mental health and health implications continue to be a problem. Lack of knowledge regarding ethnopharmacology and Asian Americans/Pacific Islanders continues to put Asian Americans/Pacific Islanders at risk. Culture-bound nosological systems, such as the Diagnostic and Statistical Manual of Mental Disorders, 4th Edition-TR (American Psychiatric Association, 1999), also do not adequately address the mental health conceptualization of many Asian Americans and Pacific Islanders. Researchers have documented that treatment adherence is influenced by the match between the client’s and the treatment provider’s explanatory model of the symptoms and illness. If the treatment orientation matches that of client, the client will be more likely to agree with the provider’s explanation and suggested treatment. If the treatment orientation is different from that of the client, the client will not likely benefit from the treatment. Indeed, many mental health treatment providers lack knowledge and training regarding the existence, prevalence, manifestation, and treatment of Asian culture-bound syndromes. For example, “hwa-byung” (Korean syndrome similar to, yet different from DSM-IV major depression), “taijin kyofyu sho” (Japanese disorder similar to, yet different from DSM-IV social phobia), and “koro” (Southeast Asian syndrome now referred to as genital retraction syndrome in the global mental health literature) are all psychological disorders that have been documented in Asian Americans/Pacific Islanders. Researchers have documented inadequate mental health treatment for Asian Americans/Pacific Islanders because of inappropriate and biased treatment models that reflect a White American, middle-class orientation.

Implications for Culturally Competent Care

- More Asian American/Pacific Islander and bilingual treatment providers are needed.
- Mental health treatment providers should be trained and educated in culturally competent treatment models.
- Culturally appropriate mental health treatment for Asian
Americans/Pacific Islanders should be cost-effective, accessible (located within Asian American/Pacific Islander communities), and provided at convenient times (e.g., after work and weekends).

• Current mainstream diagnostic systems should include specific considerations for the experience and expression of various symptoms and disorders among Asian Americans and Pacific Islanders.

• Mental health treatment providers should be knowledgeable about the prevalence, manifestation, and treatment of Asian culture-bound syndromes.

Culture-Specific Views of Mental Health and Healing

For many Asian Americans and Pacific Islanders, mental health is strongly related to physical health. In many Asian American/Pacific Islander ethnic groups, the belief is that if one is physically healthy, then one is more likely to be emotionally healthy. Emotional or psychological health is also believed to be strongly influenced by willpower or cognitive control. For example, when one is feeling sad, not dwelling on negative thoughts or avoiding negative thoughts is viewed as an appropriate coping method. In addition, focusing on one’s family or community and behaving in a way that maintains interpersonal harmony in the face of psychological distress is demonstrative of strong will and emotional health. As such, many Asian Americans and Pacific Islanders associate stigma and loss of face with admitting to psychological problems. As a result, in many Asian American/Pacific Islander cultures, individuals may often report somatic or physical manifestations of stress, as they are viewed as more acceptable than psychological symptoms. Whether these Asian Americans and Pacific Islanders experience the distress as somatic and/or psychological when having problems remains to be examined.

Indigenous healing has long been a practice of many Asian Americans and Pacific Islanders. Traditional healers are often religious leaders, community leaders, or older family members. Religion/spirituality, community, and family may also be seen as protective factors for the development of psychological distress among Asian Americans and Pacific Islanders. For example, low divorce rates and extended family households demonstrate the emphasis on family and unity. They also indicate strengths in interpersonal relationships and loyalty. In addition, this results in a strong built-in social support system for many Asian Americans and Pacific Islanders. Some traditional Asian American/Pacific Islander indigenous healing practices are controversial. For example, in some Asian cultures, “coining” and “cupping,” the practice of vigorous rubbing of coins or cups on the skin of ill children to cure them, often results in bruising. This has resulted in these parents being reported for child abuse.

Implications for Culturally Competent Care

• Treatment providers should be aware of their Asian Americans and Pacific Islander clients’ cultural beliefs related to psychological distress and how they may influence their symptoms of distress.

• Treatment providers should assess if their Asian Americans and Pacific Islander clients are experiencing both somatic and psychological symptoms of distress.

• Treatment providers should develop treatment plans that match the explanatory models of their Asian American/Pacific Islander clients and explain the treatment model to the clients and how the suggested treatment will be of benefit to the clients.

• Treatment providers should be aware of the environmental context in which their Asian American/Pacific Islander clients live and be cognizant of the implications of their suggested treatment on the clients’ family members, as it will likely influence treatment adherence.

• Treatment providers should be knowledgeable and respectful of Asian American/Pacific Islander indigenous healing practices.

Oppression and Racism as Mental Health Issues

Historically, racism and sexism toward Asian Americans and Pacific Islanders in the United States has been prevalent. Whether mandated by the U.S. government (e.g., Gentleman’s Agreement of 1860, antimiscegenation laws, unconstitutional internment of Japanese Americans during World War II) or acted upon by individuals via hate crimes, Asian Americans and Pacific Islanders continue to face oppression and racism in the United States. For many Asian Americans and Pacific Islanders, the sense of collectivism and group identity results in a shared experience of discrimination, even when such events are experienced by other Asian Americans and Pacific Islanders. Psychological researchers have documented the effects of transgenerational psychological trauma among Asian Americans and Pacific Islanders. For example, children of Japanese Americans interned during WW II experienced negative psychological sequelae from the internment. The concept of transgenerational trauma also is particularly important given the large number of Asian Americans and Pacific Islanders who have emigrated to the United States from countries ravaged by war, famine, and economic and political upheaval. Although their progeny may not have personally been tortured, raped, or beaten, their parents who did experience those atrocities may pass down the psychological trauma to them.

Many Asian Americans and Pacific Islanders are regularly bombarded with messages to assimilate and that their culture and heritage are not valued. A specific example is the English-only initiative. Rather than valuing multilingual individuals as an important resource, several states have had
Islanders are being over-medicated or prescribed medications regarding whether or not Asian Americans and Pacific Islanders metabolize and tolerate medications at different levels as compared to other ethnic groups.

Implications for Culturally Competent Care

• In addition to assessing personal experiences of racism and oppression of their Asian American/Pacific Islander clients, treatment providers should be aware of the effects of collectivism on the experience of racism and oppression of Asian Americans and Pacific Islanders.

• Treatment providers should be knowledgeable about the effects of transgenerational trauma and how it may be manifested in Asian Americans and Pacific Islanders, particularly among immigrants from war-torn countries.

• Treatment providers should assess their Asian American/Pacific Islander clients’ employment history and status, inquire about glass-ceiling effects, and assess the individual’s responses to the discrimination.

• Treatment providers should be aware of the potential harm of underdiagnosis, misdiagnosis, and over medication of Asian American/Pacific Islander individuals.

The Delivery of Culturally Competent Care for Asian Americans and Pacific Islanders

In sum, culturally competent treatment of Asian American/Pacific Islander individuals should not be the responsibility solely of Asian American/Pacific Islander treatment providers. Little effort has been made to recruit and train Asian Americans and Pacific Islanders for careers in mental health, resulting in limited numbers of Asian American/Pacific Islander clinicians. Rather, the mental health field must be accountable for providing accessible, well-trained, and knowledgeable treatment providers who can offer culturally competent interventions and services to an increasingly diverse population.

As the population of Asian Americans and Pacific Islanders continues to grow and become more diverse, the demand for appropriate services will continue to grow as well. Not providing these services will result in negative effects, not just for the Asian American/Pacific Islander population, but also for the U.S. population as a whole.
Addressing this growing need is not simple, but needs to be addressed from a systemic and multilevel perspective.

• Multilingual Asian Americans/Pacific Islanders should be valued for their skills and recruited and trained to be mental health professionals.

• Treatment providers must continually examine their own personal stereotypes and biases and how it may be affecting their work with Asian American and Pacific Islander clients.

• Treatment providers must seek knowledge, training, and skills so that they may provide culturally competent services to diverse Asian American/Pacific Islander clients.

• Training programs must be accountable for training their students to be culturally competent treatment providers. This should not be the responsibility solely of ethnic minority faculty, but all faculty in training programs must be accountable.

• Supervisors should be knowledgeable about and prepared to address issues of cultural competence in supervision.
