

Appendix B

Psychiatric composites. The Exner composite included Exner's (1993) depressed, schizophrenic, outpatient and character disordered samples (n = 1255).¹ The overall composite (n = 2188) also included our own sample (n = 933).²

¹ Exner did not offer a mean age but we calculated the average age from the data he gave to have been 34.53. He had 675 women (54%) and 580 men (46%); 81% of his sample was White, 9% African American, 8% Hispanic, and 1% Asian.

² Our data were taken from 1,670 psychiatric patients referred to the first author for psychological testing. Rorschach protocols for patients younger than 16 years of age, protocols with less than 14 responses, and protocols that had not been fully scored were excluded, reducing the sample to 930 records. The examinees were tested at one of two urban hospitals and at a private office, between the years 1980 and 2010. The mean age of examinees was 34.60 years (SD = 16.1). There were 531 women (57%) and 398 men (43%). It was estimated that psychiatric inpatients comprised 93% of the sample. The racial breakdown was 85% White, 6% African American, and 9% Hispanic. This demographic breakdown was similar to the Exner samples.
