

# Cybertools

## Cybertools

LINK	TITLE / DESCRIPTION
------	---------------------

### Experiment Bank

*The experiment bank provides a structure for the complete description of research projects. Banked experiments include a complete description of goals and methods of an ongoing or completed piece of research, including data where these are available from completed experiments. Experiments thus can be both shared and replicated or developed in another place at another time, potentially in another language.*

### Virtual Workshop

*The Virtual Workshop is web-based training covering the Experiment Bank and DTA tool. You may begin at any time, and explore the topics you choose. Work through the materials found under **Topics**. They are listed in suggested order, but you are welcome to skip to the topic you choose. View the FAQ or request consulting help under **Help**. Your **Notebook** allows you to view your completed items, past consulting questions, and page notes.*

### WebDTA Tool

*The DTA tool provides a web based structure for the entry of primary research data according to scientifically sound metadata standards. Data entered becomes part of a relational database which makes calibrated and authenticated data accessible across space and time, and ready for calibrated queries, collaboration and extension. Please refer to the [DTA manual](#) for detailed instructions.*
